The identification of anatomical regions in MRI analysis is typically done with stereotaxic atlas MRI volumes in the same spatial system as average MRI templates. Stereotaxic atlas MRI volumes classify each voxel in the volume according to its anatomical name (e.g., macroanatomical names, cerebral lobes, axonal tracts, Brodmann numbers).

A stereotaxic atlas of the brain of a ten-day-old chick was constructed, using 20mm sections at 0.25mm intervals throughout the whole brain. Sections were cut in both coronal and saggital planes. The stained tissue was accurately drawn to show brain structure, and then photographed using macro techniques.

A stereotaxic brain atlas of the longtailed macaque (Macaca fascicularis) is presented in a format suitable for use as a template atlas of the macaque brain. It includes most of the brain segmented to show the boundaries of landmark structures such that every point in the brain can be represented by a unique set of coordinates in three-dimensional space and ascribed unambiguously to one and only one primary structure.

Abstract. Outline drawings of representative frontal sections of the Macaca fascicularis brain are presented in stereotaxic coordinates. The levels extend from the rostral tip of the neostriatum to the posterior end of the deep cerebellar nuclei. The illustrations are based on photographs of unstained frozen sections of three formalin-fixed brains in which stainless steel needles were inserted to mark the horizontal zero and several anteroposterior positions.

The stereotaxic apparatus comprises a U-shaped stereotaxic frame mounted on a baseplate. Three mechanical elements (microdrives) fixed upon the frame allow travel of an electrode (or cannula) holder along three orthogonal axes: forward and backward, up and down, and side to side (Fig. 4.1). This micromanipulator assembly is fixed to the side of the frame and can be moved in three dimensions by three micrometric vernier screw drives.

Brain registration to a stereotaxic atlas is an effective way to report anatomic locations of interest and to perform anatomic quantification. However, existing stereotaxic atlases lack comprehensive coordinate information about white matter structures. In this paper, white matter-specific atlases in stereotaxic coordinates are introduced.
