This book outlines the essential knowledge required for the management of critically ill and severely injured children. It is designed to facilitate successful completion of the Pediatric Emergency Medicine Board Examination of the American Board of Pediatrics (ABP). Each chapter follows a Question & Answer format, covering major areas in pediatrics such as cardiology, dermatology, nephrology, surgery and trauma. The book concludes with a comprehensive practice test, allowing it to function as a well-rounded reference and study guide. Prepare for the Pediatric Emergency Medicine Board Examination is an essential resource for any clinician or trainee seeking a concise review of how to manage critically ill and severely injured children.

Psychiatrists and residents are faced with the important -- but what may feel overwhelming -- task of refreshing their knowledge of the whole of psychiatric practice, typically while remaining engaged in full-time clinical activity. Psychiatrists will find the logical structure, substantive questions, and thorough explanations provided by the Study Guide for the Psychiatry Board Examination to be as reassuring as they are educational. Although readers are advised to consult a range of resources in preparation for the examination, this guide is indispensable. It is the first and only guide to reflect the revisions contained in DSM-5®, and it will ably assume a primary role in the study and review process. The guide is designed for maximum usefulness, with specific features and attributes to support knowledge recall and successful examination performance. * The authors are from a cross-section of accomplished students, fellows, and junior and senior faculty, all of whom have faced or will face the board examination and who understand its importance to the profession.* Topics were determined by the American Board of Psychiatry and Neurology Certification Examination in Psychiatry 2015 Content Blueprint.* The approximately 400 questions were formulated from information extracted from widely available American Psychiatric Publishing textbooks and accurately reflect the accepted psychiatric knowledge base.* Each multiple choice question is followed by an explanation of why the correct answer is correct and the others are incorrect, and every question and explanation is referenced, directing the reader to the primary material for more in-depth learning and study.* The volume was designed as a study guide for both the initial psychiatry board examination and the recertification examination. The process of working through the study guide will allow the reader to identify areas of strength and weakness, initiate further study, and test and retest knowledge, ultimately preparing for the examination's rigors. Only the Study Guide for the Psychiatry Board Examination offers support for the new, DSM-5® -- compatible examination, and that alone renders it essential.

As the population ages, technology improves, intensive care medicine expands and neurocritical care advances, the use of EEG monitoring in the critically ill is becoming increasingly important. This atlas is a comprehensive yet accessible introduction to the uses of EEG monitoring in the critical care setting. It includes basic EEG patterns seen in encephalopathy, both specific and non-specific, nonconvulsive seizures, periodic EEG patterns, and controversial patterns on the ictal–interictal continuum. Confusing artefacts, including ones that mimic seizures, are shown and explained, and the new standardized nomenclature for these patterns is included. The Atlas of EEG in Critical Care explains the principles of technique and interpretation of recordings and discusses the techniques of data management, and 'trending' central to long-term monitoring. It demonstrates applications in multi-modal monitoring, correlating with new techniques such as microdialysis, and features superb illustrations of commonly observed neurologic events, including seizures, hemorrhagic stroke and ischaemia. This atlas is written for practitioners, fellows and residents in critical care medicine, neurology, epilepsy and clinical neurophysiology, and is essential reading for anyone getting involved in EEG monitoring in the intensive care unit.
