Heterogeneity A

In statistics, homogeneity and its opposite, heterogeneity, arise in describing the properties of a dataset, or several datasets. They relate to the validity of the often convenient assumption that the statistical properties of any one part of an overall dataset are the

In meta-analysis, which combines the data from several studies,

homogeneity measures the differences or similarities between the several studies.

Fundamental to the design of a focus group study is group composition.

Specifically, the researcher must determine the degree of homogeneity or heterogeneity that should be represented by the group participants.

Primary studies heterogeneity caused by between-study differences is an expected circumstance.

Its analysis is crucial for defining whether selected primary studies pooling is fit for meta-analysis. Heterogeneity can manifest in two ways, with corresponding procedures:

- Clinical heterogeneity: It requires assessment based on clinical grounds. •
