Information Theory is one of the few scientific fields fortunate enough to have an identifiable beginning - Claude Shannon's 1948 paper. The story of the evolution of how it progressed from a single theoretical paper to a broad field that has redefined our world is a fascinating one. It provides the opportunity to study the social, political, and technological interactions that have helped ...

Color theory is a practical combination of art and science that's used to determine what colors look good together. The color wheel was invented in 1666 by Isaac Newton, who mapped the color spectrum onto a circle. The color wheel is the basis of color theory, because it shows the relationship between colors. Colors that look good together are called a color harmony. Artists and designers ...

Information theory studies reveal that the information encoded by the simultaneous activity of neurons can be independent, redundant or synergistic (Schneidman et al., 2003). These activity modes are related to the level of pair-wise correlations between the neuronal elements of the network. Usually, we can assume that a correlated network is redundant. In that case, the information encoded by ...
