The psychology of science sets out to empirically investigate the full range of psychological processes behind scientific behaviour, interest, talent and creativity. To be sure, the field is immature and relatively late in developing compared to the other studies of science.

In Psychology: The Science of Person, Mind, and Brain, experienced teacher, researcher, and author Daniel Cervone provides students with a new and exciting way of understanding psychology. Cervone organizes material around three levels of analysis -- person, mind, and brain -- and employs a person-first format that consistently introduces topics at the person level: theory and research on the lives of people in sociocultural contexts. Students are able to make sense of the latest research through what they understand best: people. With fellow teacher and researcher Tracy Caldwell, Cervone has conceived a text beyond the print experience from the ground up, integrating online immersive research experiences and assessment tools that capitalize on research findings on pedagogy and student learning (e.g., the testing effect). Pedagogical Author, Tracy L. Caldwell Working closely with Daniel Cervone, fellow teacher and researcher Tracy Caldwell of Dominican University developed the book's pedagogical program from the Preview Questions at the beginning of each section to the Self-Tests at the end of each chapter. The pedagogy is designed to engage students at multiple levels of Bloom's taxonomy and at multiple points in each chapter.

A major development in psychological science is increased recognition that persons and environments constitute dynamically interacting systems. This book presents advances from internationally renowned researchers in personality, social, cognitive, developmental, and cultural psychology, and other fields, who construct a science of the individual by studying individuals in context. Contributors build on seminal work by Walter Mischel (especially his citation classic, "Toward a Cognitive Social Learning Reconceptualization of Personality," reprinted in the volume). A commentary from Mischel himself places the contributions in historical perspective and articulates the novel portrait of human nature that they yield.

The Person provides psychologists with an organizational scheme for personality psychology. This sets the study of the person into evolutionary and cultural context and divided personality up into three broad areas: dispositional traits, characteristic adaptations, and integrative life stories. The fifth edition has been updated to reflect advances that have occurred in the field of psychology in the past few years. It presents new findings that have been obtained with respect to the correlates of personality traits, the dynamics of motives and goals in human lives, and the meanings and manifestations of life stories. Discussions are included on the new ideas on evolution and morality as well as the role of culture in personality. Psychologists will also find a much stronger and detailed discussion of psychophysiology of

extraversion, neuroticism, and the trait of sensation-seeking.

Descriptive Psychology and the Person Concept maps the common ground of behavioral science. The absence of a shared foundation has given us fragmentation, a siloed state of psychological theory and practice. And the science? The integrity of choice, accountability, reason, and intention are necessary commitments at the cornerstone of civilization and any person-centered psychotherapy, but when taught along with a "scientific" requirement for reductionism and determinism, reside in contradictory intellectual universes. Peter Ossorio developed the Person Concept to remedy these problems. This book is an introduction to his work and the community of scientists, scholars, and practitioners of Descriptive Psychology. Ossorio offered these maxims that capture the discipline's spirit: 1. The world makes sense, and so do people. They make sense to begin with. 2. It's one world. Everything fits together. Everything is related to everything else. 3. Things are what they are and not something else instead. 4. Don't count on the world being simpler than it has to be. The Person Concept is a single, coherent concept of interdependent component concepts: Individual Persons; Behavior as Intentional Action; Language and Verbal Behavior; Community and Culture; and World and Reality. Descriptive Psychology uses preempirical, theory-neutral formulations and methods, to make explicit the implicit structure of the behavioral sciences. The goal is a framework with a place for what is already known with room for what is yet to be found. Provides a way to compare theories, coordinate empirical findings, and negotiate competent disagreement Offers guidance for effective case formulation and integration of therapies Explores the dilemmas of personhood and the complexities of human and nonhuman action, investigating "what is a person, and how can we be sure?" Follows the implications of Hedonics, Prudence, Ethics, and Aesthetics as intrinsic perspectives and reasons for action Applies these concepts to personality and social dynamics, consciousness, relationship change, emotional behavior, deliberation, and judgment Provides a guide to establishing and restoring empathy--especially when it's difficult

Worthington suggests that the relationship between psychological science and Christianity is less like a war or mere dialogue and more like an emerging marriage. In this relational model of psychology and Christianity, there may be marital spats at times but also great potential for an intimate, mutually fulfilling relationship.

In this fresh new offering to the Intro Psychology course, authors John Cacioppo and Laura Freberg portray psychology as being an integrative science in two ways. First, they have written a text that reflects psychology's rightful place as a hub science that draws from and is cited by research in many other fields. Second, this text presents psychology as a unified science that seeks a complete understanding of the human mind, rather than as a loosely organized set of autonomous subspecialties. As psychology moves rapidly toward maturity as an integrative, multidisciplinary field, the introductory course offers an opportunity to teach all of psychology in one place and at one time. This text reflects that evolution--and the authors' excitement about it.
